

ENGINE AIR FILTERS

ENHANCED ENGINE PERFORMANCE

Engines run on a mixture of gasoline and air. Increased air flow improves engine performance.

SUPERIOR ENGINE PROTECTION

Up to 99% cleaner air that flows into the engine. Higher capacity for particles, dust, or other debris removal. Such containment can cause damage to engine part.

Changing Air Filters is Mandatory:

Air filter should be replaced every 12,000 miles or a year, whichever comes first. Air filter should be checked at every oil change to ensure that your filter is clean and free of debris. Various road conditions and driving habits may require more frequent change.
